The aim of these observations (by the Central Aerological Observatory in 1955-1957) was the study of the character of the radio-echo obtained from convection clouds, and the discovery of the features of the reflections connected with the development of shower clouds in different synoptic-aerological conditions. The observations were carried out with a "Cobalt" 3.2-cm radio-locator. (This radio-locator detects only those regions of clouds which contain large
